

# PARKINSON'S DISEASE

## CLINICAL STUDY

### Integrative Research Labs AB

Are conducting a clinical study to investigate a new treatment for Parkinson's disease dyskinesia.

We are inviting patients with a diagnosis of Parkinson's disease who now have dyskinesia as a result of taking Levodopa to participate in an up to two months study.

Researchers across the UK are investigating a new product, which has been developed to reduce symptoms of Levodopa induced dyskinesia.

Dyskinesias are the uncontrollable movements such as twitching, jerking and writhing often seen as a side-effect to long term treatment of Parkinson's disease with Levodopa.

If you think you are experiencing the above symptoms, and you have a diagnosis of Parkinson's disease, then please speak to your Doctor or Parkinson's nurse about possibly taking part.

Participation is entirely voluntary.

Alternatively, please contact the Research Team on **01382 632287 or 07795 447178**
